

Image Management Guide

Purpose

This guide defines the standard approach for storing, organizing, and referencing screenshots, architecture diagrams, email captures, flow diagrams, and other visual assets within the Engineering Knowledge Base.

The goal is to ensure:

- Images remain searchable
- Project context is preserved
- Copilot can understand surrounding documentation
- Visual references are easy to find months or years later
- The repository remains organized and scalable

Repository Structure

Store all visual assets inside a dedicated `assets` folder.

```
Engineering-Knowledge-Base/
```

```
assets/
```

```
|
```

```
├─ azure-data-pipeline/
```

```
├─ unified-storefront/
```

```
├─ imanage/
```

```
├─ vulnerabilities/
```

```
├─ production-support/
```

```
└─ infrastructure/
```

```
daily-logs/
```

```
projects/
```

```
decisions/
```

```
action-items/
```

```
templates/
```

Each project should have its own asset folder.

File Naming Standard

Always use the following naming convention:

```
YYYY-MM-DD-description.png
```

Examples:

```
2026-06-08-adf-deployment.png
2026-06-08-firewall-rules.png
2026-06-09-prod-error.png
2026-06-10-architecture-v3.png
2026-06-15-release-plan.png
```

Benefits:

- Files sort chronologically
- Easy historical tracking
- Easier searching
- Better Copilot context

Daily Log Image Usage

Images can be embedded directly into daily logs.

Example:

```
## Azure Data Pipeline

### Investigation

#### Screenshot

![ADF Deployment](../../assets/azure-data-pipeline/2026-06-08-adf-
deployment.png)

### Notes

- Discussed deployment strategy
- Support team requested TLS validation
```

Use images when:

- Capturing architecture reviews
- Recording deployment evidence
- Storing troubleshooting screenshots
- Preserving important email communications
- Documenting incidents

Project Summary Image Usage

Project files should maintain long-term visual references.

Example:

```
# Azure Data Pipeline

## Architecture Diagrams

### Current Architecture

![Architecture](../assets/azure-data-pipeline/architecture-v3.png)

## Data Flow

![Data Flow](../assets/azure-data-pipeline/data-flow.png)

## Historical Screenshots

### June 2026 Deployment

![Deployment](../assets/azure-data-pipeline/2026-06-08-adf-deployment.png)
```

Recommended sections:

```
## Architecture Diagrams

## Screenshots

## Visual References

## Historical Evidence
```

Relative Links Standard

Always use relative paths.

Preferred:

```
![Architecture Diagram](../assets/azure-data-pipeline/architecture-v3.png)
```

Avoid:

```
https://example.com/image.png
```

Benefits:

- Works offline
- Portable repository
- Git tracks files
- Easier backups
- Better long-term maintainability

Asset Documentation

Each project asset folder should contain a README file.

Example:

```
assets/  
└─ azure-data-pipeline/  
    ├── README.md  
    ├── architecture-v3.png  
    ├── data-flow.png  
    └─ 2026-06-08-adf-deployment.png
```

Asset README Template

Example:

```
# Azure Data Pipeline Images
```

```
## architecture-v3.png
```

Current architecture diagram as of June 2026.

```
## data-flow.png
```

Azure Data Factory data flow architecture.

```
## 2026-06-08-adf-deployment.png
```

Deployment planning screenshot from architecture review.

```
## 2026-06-15-release-plan.png
```

Release planning discussion with stakeholders.

This improves repository searchability and provides additional context for Copilot.

Recommended Image Types

Store:

- Architecture diagrams
- Deployment diagrams
- Network diagrams
- Azure portal screenshots
- Error screenshots
- Incident evidence
- Security findings
- Release schedules
- Email captures
- Whiteboard captures
- Process diagrams

Avoid storing:

- Temporary screenshots
 - Duplicate screenshots
 - Large videos
 - Personal content
 - Unrelated images
-

Copilot Usage Examples

Find Related Screenshots

Search all Azure Data Pipeline screenshots related to deployment discussions.

Summarize Visual Evidence

Review all images referenced in Azure Data Pipeline notes from June 2026 and summarize key findings.

Architecture Analysis

Compare architecture-v2.png and architecture-v3.png and summarize the major changes.

Incident Investigation

Review all screenshots associated with production incidents during the last 90 days and identify recurring themes.

Best Practices

- ✓ Capture screenshots only when they provide business or technical value.
- ✓ Store screenshots inside project-specific asset folders.
- ✓ Use descriptive file names.
- ✓ Reference screenshots from daily logs.
- ✓ Promote important screenshots into project summary files.
- ✓ Maintain asset README files.
- ✓ Use relative markdown links.

- ✔ Treat diagrams and screenshots as long-term project knowledge.

Following this standard ensures that images become a searchable part of the knowledge base and can be leveraged effectively by GitHub Copilot Agent Mode.
